## Appendix A A Summary of Various Models

Table A.1 shows a short summary of several characteristics of the models discussed here. These properties generally hold, but are not always true for every problem. For example, linear discriminant analysis models do not perform feature selection, but there are specialized versions of the model that use regularization to eliminate predictors. Also, the interpretability of a model is subjective. A single tree might be understandable if it is not excessively large and the splits do not involve a large number of categories.

As stated in Chap. 2, no one model is uniformly better than the others. The applicability of a technique is dependent on the type of data being analyzed, the needs of the modeler, and the context of how the model will be used.

Table A.1: A summary of models and some of their characteristics

CS, NZV, Corr   CS   CS   CS   CS   CS   CS   CS	Model	Allows $n < p$	Pre-processing	Interpretable	Automatic feature selection	# Tuning parameters	Robust to predictor noise	Computation time

Symbols represent affirmative  $(\checkmark)$ , negative  $(\times)$ , and somewhere in between  $(\circ)$ 

- CS = centering and scaling
- NZV = remove near-zero predictors
- Corr = remove highly correlated predictors
